Steppers can help you lose weight, as you burn calories each time you exercise with one. Since it is a low-impact, moderate exercise, you do not burn very many calories each time you use it. But with consistency, doing interval training with a mini stepper can increase your resting metabolic rate.

Exercising with a stepper utilizes the same muscles needed to walk or climb stairs. There is a slight resistance that your legs must push against with each step. Therefore, exercising with one regularly can help tone the lower body muscles, including the glutes, hamstrings, quadriceps and calf muscles.
